ABSTRACT OF THE DISCLOSURE

[0036]   An electronic bulletin board for use in a shared always-on environment wherein a user may manipulate messages from a remote location. The electronic bulletin board may be implemented via database and programming logic on an application server accessible from any network node, including wireless devices. The always-on environment may be set up on a computer or broadband internet appliance or other communications device. Remote users may perform operations such as updating an existing message, posting a new message, download messages, and the like. The bulletin board also supports shared messages designed for special purposes, for example, an electronic grocery list that is accessible from remote locations.
